TRB's Mission Is 'To Establish a System of Quality Roads to Meet the Transportation Needs of Current and Future Customers' The Transportation Research Board (TRB) is a US government agency and is responsible for the development of the human, transportation and environmental science and technology needed to meet the challenges of an environmentally sound transportation system. TRB is an independent agency established by Congress in 1970. As the premier transportation research organization, TRB assists with the development of new and innovative technologies to improve safety, security, and energy efficiency. Today, the TRB is responsible for guiding new transportation technology across a continuum of meaningful programs, including research, evaluation, and funding opportunities. In recent years, the TRB has expanded its mission to include the oversight of all transportation research and development. It is composed of 33 members appointed by the President and confirmed by the Senate. Nineteen of the members are appointed by the Department of Transportation, one by the Department of Energy, and one by the National Science Foundation. The remaining 14 members, who are appointed by the President, are the heads of the 30 federal agencies and departments that fund transportation research. Members from the private sector are also eligible for appointment to the TRB. During fiscal year 2015, the TRB awarded approximately $202 million in grants and contracts on behalf of the federal government. Methodology TRB commissioned us to collect information and data on how members of the TRB view and use their research programs, as well as their opinions on the policy processes of the TRB. This includes: Members' uses of and views on the TRB How they use the various research programs in the TRB What research goals they pursue and what priorities they see as most important The distribution of the budgets in each of the TRB's three major programs: research, education and training, and technology and innovation Respondents were not given the option to complete the survey twice; we have therefore included only a single set of data for each respondent. We calculated the percentages by dividing the number of respondents who answered a particular question by the total number of respondents who took the survey. All percentages are rounded. The survey was sent by email to all of the TRB's current members (approximately 622) and to each member of the TRB's board of governors. Respondents TRB members eligible for this survey include all

What's New in the?

, i.e. seconds. The wind turbine system now also has a built in energy generation meter as the wind generation value. This value is integrated with the standard turbine system value for all power output calculations on the system, but can also be checked separately. The wind turbine system values are now also displayed in the turbine data report. In new systems, the display options of the wind turbine system value can be configured in the System tab of the setup page. The display is now always in percentage and displayed in a smaller font than the turbine data. Creating a new location for the wind turbine system and assigning the wind turbine system values to this location The location for the wind turbine system can now be changed in the location overview screen. This allows for new locations with a desired name in any existing group. Wind turbine system as source of water heating The FAN efficiency value is now also taken into account for the calculation of the water heating value. The wind turbine system can now also be used for water heating. In this case the heat storage capacity of the system is usually increased. Internal settings The wind turbine system can now have all of its service runs which are predefined. Smart service runs The wind turbine system now includes predefined sets of service runs which can be set by the wind turbine system itself. Internal settings of the parameters in the wind turbine system The wind turbine system can now include custom values for the parameters in the turbine data spreadsheet. The parameters are configured in the System tab of the setup page. Wind generator system and electricity market Service runs The wind turbine system can now generate service runs for the wind turbine and the wind generator, with which the system can be synchronized to the electricity market. Incoming power data The wind turbine system can now calculate power consumption data from the incoming power meter in the wind turbine system. Battery power consumption The wind turbine system can now also detect and calculate the power consumption of the battery charger in the wind turbine system. Turbine technical parameters The wind turbine system can now also update its turbine technical parameters, such as pitch, power, efficiency and transmission, from the turbine data spreadsheet. Buildings with wind turbine systems The wind turbine system can now also update its building type directly from the wind turbine system settings. Assignment of wind turbine

system values to locations
