Postoperative nausea and vomiting after mini-laparotomy compared with conventional cholecystectomy. Postoperative nausea and vomiting (PONV) is a serious complication of general anaesthesia. Postoperative pain might be a causative factor. The aim of the study was to compare the incidence of PONV after mini-laparotomy cholecystectomy (MLC) with that after conventional cholecystectomy. In a prospective, randomized double-blind study, a total of 201 adult patients having elective cholecystectomy were randomly assigned to the MLC or conventional cholecystectomy group. The rate and severity of PONV were assessed at 1, 3, and 24 h after surgery. Other indicators, such as pain, sedation, and paracetamol demand, were also recorded. The incidence of PONV was 56.1% (65/118) in the MLC group, and 58.8% (66/112) in the conventional cholecystectomy group. The incidence of PONV within the first 24 h after surgery was not significantly different between the two groups, but 24-h PONV was more frequent and severe in the MLC group than in the conventional cholecystectomy group. Mean visual analogue scale (VAS) scores for pain

System Requirements For UV Weather:

General Notes: •The space is 20:1, so you need a pretty big map to be able to fight as intended. •There are seven parts to this server, each with its own set of rules: Alliance - hostile factions, except Empire. Empire - friendly factions, except Alliance. Hostile - total anarchy. You can attack the enemy any time, but you are never allowed to attack your allies, or any other faction. You may be attacked if you are involved in a siege. If you are attacked
